REVISED FEB. 14, 1989

1988 GRAIN DUST EXPLOSIONS LOWEST SINCE 1975*

Twelve grain dust explosions were reported in the U.S. in 1988 according to data compiled by Ralph Regan, FGIS Safety Director and Robert W. Schoeff, Extension Marketing and Safety Specialist, Kansas State University. This compares to 15 in 1987 and a 10 year average of 20 explosions.

The not-so-good news was the 8 fatalities compared to none in 1987 and 1983. Ten injured was also a record low.

Most of the explosions continue to occur in grain elevators, 7 of 12, with 2 in corn processing plants.

The principal location of the primary explosion was the elevator leg, 4, and dust systems, 4 of 12.

The cause of the primary explosion remains unknown in 8 of the 12 explosions. Extension light, fire and metal sparks were identified as other probable causes.

Corn dust was involved in 8 of 12 cases; wheat, oats, rice and soybeans in the other four.

Explosions occurred in 10 states; 3 in Minnesota, 1 each in Alabama, Arkansas, Illinois, Indiana, Iowa, Kentucky, Louisiana, Oklahoma and Texas.

One agricultural dust explosion occurred in a sugar plant in California.

Appreciation is expressed to the many people who were willing to provide this information which is based on voluntary reports and published information.
