# 2015 KANSAS SOYBEAN PERFORMANCE TESTS

## TEST OBJECTIVES AND PROCEDURES

Soybean performance tests are conducted each year to provide information on the relative performance of new and established varieties and brands at several locations in Kansas.

Seeds for tests are from private seed companies, certified growers, and agricultural experiment stations (Table 1). Seed quality, including factors such as purity and germination, can be important in determining the performance of a variety. Soybean seed used for private and public entries in the Kansas Crop Performance Tests is prepared professionally and usually meets or exceeds Kansas Crop Improvement Certification standards. Relative performance of a given variety comparable to that obtained in these tests is best assured under similar environmental conditions and cultural practices and with the use of certified or professionally prepared seed. All companies known to be developing and marketing soybean varieties or brands are invited to submit test seed; interested companies enter on a voluntary, fee-entry basis. Companies were invited to enter Roundup-resistant varieties in either the Roundup trials or the conventional/Liberty Link trials at Scandia, Ottawa, or Parsons.

Entries were planted in four-row plots with rows 30 inches apart and were replicated three or four times each. Seeding rate ranged from 7 to 12 seeds per foot of row. The center two rows of each plot were harvested for yield. Harvested row lengths ranged from 11 to 33 feet, depending on location. Cultural practices and rainfall for each test location are presented with each table. Results from this year's tests are presented in Tables 2 through 21. Relative yields of each entry from all locations are shown in Tables 22 and 23. Test results also can be found online at: <http://www.agronomy.k-state.edu/services/crop-performance-tests/soybean>

## DATA INTERPRETATION

**Yields** are recorded as bushels per acre (60 lb/bushel) adjusted to 13% moisture content, when moisture data are available. Seed yield also is expressed as a percentage of the test average to assist in identifying entries that consistently produce better than the average yield.

**Maturity** is the date on which 95% of the pods have ripened (browned). Delayed leaf drop and green stems are not considered when assigning maturity. About 1 week of good drying weather after maturing is needed before soybeans are ready to harvest.

**Lodging** is rated at maturity by the following scores:

1. Almost all plants erect
2. All plants slightly leaning or a few plants down
3. All plants leaning moderately (45%) or 25 to 50% of plants down
4. All plants leaning considerably or 50 to 80% plants down
5. Almost all plants down

**Height** is the average length from the soil surface to the top of the main stem of mature plants.

## VARIETY OR BRAND SELECTION

Performance of soybean varieties or brands varies from year to year and from location to location, depending on factors such as weather, management practices, and variety adaptation. When selecting varieties or brands, producers should carefully analyze variety performance for two or more years across locations. Performance averaged over several environments will provide a better estimate of genetic potential and stability than performance based on a few environments.

Small differences in yield between any two varieties or brands usually are not important. Within maturity groups at each location, a LSD (least significant difference) was calculated. The significance level used to calculate the LSD was 10%. Unless two varieties differ in yield by more than the LSD, genetic yield potential of one entry cannot be considered superior to that of another.

The coefficient of variability (CV) represents an estimate of the precision in the replicated yield trials. A CV of less than 10% indicates a good test with a high level of reliability. CVs ranging from 10 to 15% are usually acceptable for performance comparisons. CVs greater than 15% generally lack sufficient precision to provide any more than a rough guide to cultivar performance. For tests in which the precision was insufficient to statistically compare performance among the entries, the LSD value has been replaced with the designation NS, indicating that seed yields were not significantly different.

**Lance Rezac Farm, Onaga, Pottawatomie County; Bill Schapaugh, agronomist**

Excessive soil moisture delayed planting until 6/22/2015. Wet conditions continued throughout vegetative development and limited plant growth. During late pod-fill soil moisture became limiting, stressing the plants and reducing yields.

April May June July Aug. Sept. Total  
 Rainfall: 1.6 10.3 6.8 8.8 3.3 3.8 34.6

Planted 6/22/2015 at 8 seeds/ft; harvested 10/21/2015; 11 ft. by 4-row plot; pesticides: Cobra and Select as POST.

**Kansas River Valley Experiment Field, Topeka, Shawnee County: Eric Adee, agronomist**

Season started off very wet, receiving more than 10 inches of rain in May, about average rainfall in June, then 6-7 inches in July. Combined with moderate temperatures, the growing conditions were very good, resulting in taller than usual soybeans. Only received 2 irrigations in late August and early September. Contrary to expectations due to wet conditions, sudden death syndrome was not as severe as in the past, showing up later and percent of defoliation was less than in previous years. As a result, the yields were much higher than previous years.

	April	May	June	July	Aug.	Sept.	Total
Rainfall:	2.3	10.3	4.4	6.1	2.7	6.3	32.1

**East Central Kansas Experiment Field, Ottawa, Franklin County; Eric Adee, agronomist**

A very wet spring delayed planting slightly with more than 18" of rain in April, May, June and July. July thru harvest, received a little more than 8" of rain.

Growing conditions were good with most varieties reaching late season canopy. Weed control was excellent and yields were very favorable considering wet conditions early in the season.

	April	May	June	July	Aug.	Sept.	Total
Rainfall:	3.5	10.7	4.4	3.3	2.3	3.5	27.7

Planted 6/10/2015 at 8 seeds/ft; harvested 10/21/2015; 26 ft. by 4-row plot; pesticides: Pre-emerge applied June 10- 7 oz Authority XL + 1.5 pt Cinch. Post-emerge applied July 22- 22 oz Roundup PowerMax + AMS.

Excerpts from the  
University Research Policy Agreement with Cooperating Seed Companies

Permission is hereby given to Kansas State University (KSU) to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1121, '2015 Kansas Performance Tests with Soybean Varieties,' or the Kansas Crop Performance Test website, [www.agronomy.k-state.edu/services/crop-performance-tests/index.html](http://www.agronomy.k-state.edu/services/crop-performance-tests/index.html), for details. Endorsement or recommendation by Kansas State University is not implied."
