Excerpts from the
UNIVERSITY RESEARCH POLICY AGREEMENT
WITH COOPERATING SEED COMPANIES*

Permission is hereby given to Kansas State University to test our varieties and/or hybrids designated on the attached entry forms in the manner indicated on the test announcement. I understand that all results from Kansas crop performance tests belong to the University and to the public and shall be controlled by the University so as to produce the greatest benefit to the public. It is further agreed that the name of the University shall not be used by the company in any commercial advertising either in regard to this agreement or any other related matter.

*This agreement must be signed by an authorized individual before results involving the company's entries can be published by the Experiment Station. Except for the limitation that the name "KANSAS STATE UNIVERSITY" cannot be used in advertising (you may use something like "official state tests" or "state yield trials"), this does not preclude the use of data for advertising, if done in a fair manner.

Contribution No. 03-244-S from the Kansas Agricultural Experiment Station.

2002 KANSAS PERFORMANCE TESTS WITH SUNFLOWER HYBRIDS

INTRODUCTION

TEST OBJECTIVES AND PROCEDURES

Sunflower performance tests were conducted in 2002 by the Kansas Agricultural Experiment Station to provide farmers, extension workers, and private industry with unbiased agronomic information on many of the sunflower hybrids marketed in the state. Tests were financed in part by entry fees from private companies. Companies known to be developing and marketing sunflowers were invited to participate and enter hybrids on a voluntary fee-entry basis. So, not all hybrids grown in the state were included in tests, and hybrids were not grown uniformly at all locations.

Eight test locations in 2002 included Republic County and Greeley County—dryland; Reno County, Harvey County and Sumner County—dryland, continuous crop; Sherman County fallow and Thomas County—irrigated and fallow sites. Tests in Sherman and Sumner Counties had to be abandoned because of drought conditions. Oilseed entries were grown at all locations. Confectionary entries were included only in tests in Thomas, Sherman and Greeley Counties. Oilseed and confectionary entries were planted separately in all tests. Entries were planted in four-row, replicated plots at all locations. To ensure uniform and adequate stands, all tests were planted at a high seeding rate and hand thinned after emergence to desired stands.

Environmental factors affecting test results and cultural practices are discussed individually for each of the test sites. Test results for 2002, as well as period-of-years average data, are included in Tables 1-14. Entrants and entries in 2002 tests are listed at the end of the report.

DATA INTERPRETATION

Yields are reported as lbs seed/a adjusted to 10% moisture content.

Days to half bloom is number of days from date of planting to date when 50% of plants were in bloom.

Lodging percent is based on counts of lodged and total plants in harvested areas at all locations.

Oil percent was obtained from samples submitted under code number to the Kansas Grain Inspection Service for analysis and is reported on a 10% moisture basis. Samples for all tests were derived by compositing replications by entry for each location and subsampling.

Oil yields are reported as net lbs oil/a.

Seed size percent analysis for confectionary-type entries was performed at the Northwest Research-Extension Center on cleaned samples submitted from each of the tests. Separation by seed size was made by screening a weighed sample through a series of six sieves (22/64, 21/64, 20/64, 19/64, 18/64, and 16/64-round holes) secured on a Ro-Tap mechanical shaker.

Statistical analysis Conducting perfect tests is virtually impossible, because soil fertility, moisture, and other environmental factors vary. Therefore, small differences in results may have no real meaning. To help interpret data, we applied a statistical technique, analysis of variance, wherever possible. Such analysis requires repeating whole sets of varieties or treatments several times and placing individual varieties or treatments as they would be placed by chance alone. Results of the analyses are reported in terms of least significant

differences (LSD). If two means differ by more than the LSD (.05), such a difference would be due to chance variation only 5% of the time. So, it's 95% probable that the difference was due to treatment. If means do not differ by as much as the LSD, then little confidence can be placed in the importance

of varietal or treatment differences. The coefficient of variability (CV) represents an estimate of the precision of replicated yield trials. CVs ranging from 10 to 15% are usually acceptable for performance comparisons. CVs greater than 15% provide only a rough guide to hybrid performance.

ACKNOWLEDGEMENTS

Cooperation of Research Center personnel who performed many of the field operations is sincerely appreciated. Vicki Brown, secretary, and Kraig Roozeboom, coordinator – Kansas Crop Performance Tests, assisted in preparing this report; and temporary workers Samantha Wolf, and Cade Moses, helped with seed counting and plot thinning and maintenance. Mary Knapp at the Weather Data Library provided climatological data, and James R. Cochrane, Assistant Scientist, provided weather charts and posted data to the web site.

NORTH CENTRAL KANSAS DRYLAND SUNFLOWER TEST

LOCATION: Mark Studer Farm, Beloit

POPULATION: 22,000 plants/a

COOPERATOR: Barney Gordon, agronomist

TEST YIELDS:

TEST SITE: Harrey silt loam

Avg. (lbs/a): 996

Range (lbs/a): 623 - 1315

Grain Sorghum 2000, Fallow 2001

LSD (lbs/a): 159

CV (%): 12

FERTILIZATION: 100-50-0

PLANTING DATE: 6/12/02

2002 GROWING CONDITIONS

BLOOM DATES: -

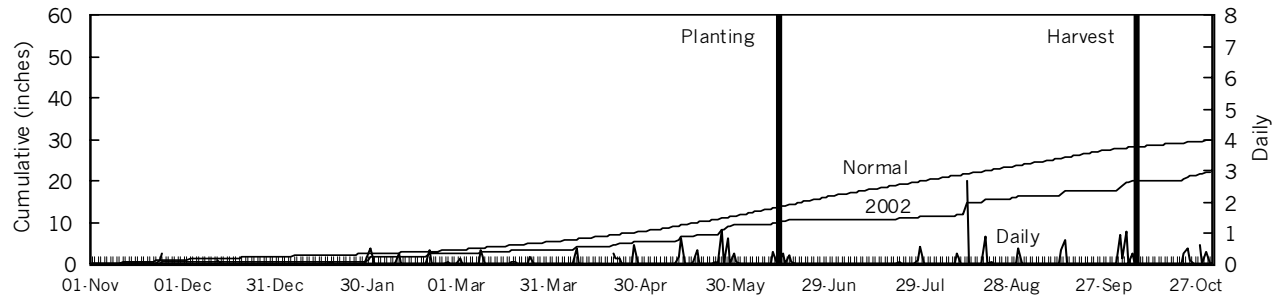

The test was planted on the Mark Studer farm 9 miles N.E. of Beloit. Good stands were established in all plots, however the summer was very dry. There were few insect or disease problems.

HARVEST DATE: 10/7/02

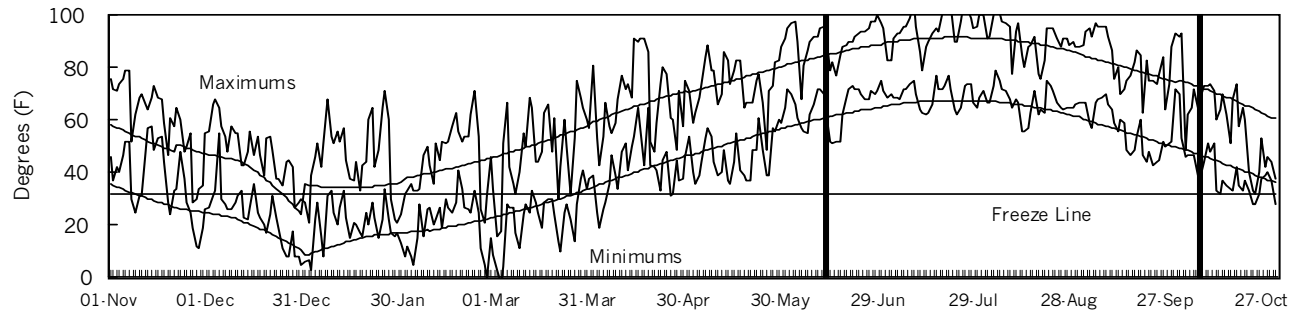

PEST CONTROL:

Prowl

2002 GROWING CONDITIONS

Good stands were established, however plants were stripped by hail on June 15, causing loss of some stand. Very high wind and hail August 12 caused all plants to lay over with heads on the ground. Heads matured laying on the ground.

SOUTH CENTRAL KANSAS SUNFLOWER TEST

LOCATION: Harvey County Experiment Field, Hesston

POPULATION: 22,000 plants/a

COOPERATOR: Mark Claassen, agronomist

TEST YIELDS:

TEST SITE: Smolan silty clay loam

Avg. (lbs/a): 1547

Soybean 2000, Soybean 2001

Range (lbs/a): 805 - 2040

FERTILIZATION: 64-46-0

LSD (lbs/a): 380

PLANTING DATE: 6/26/02

CV (%): 21

BLOOM DATES: 8/20/02 - 8/24/02

2002 GROWING CONDITIONS

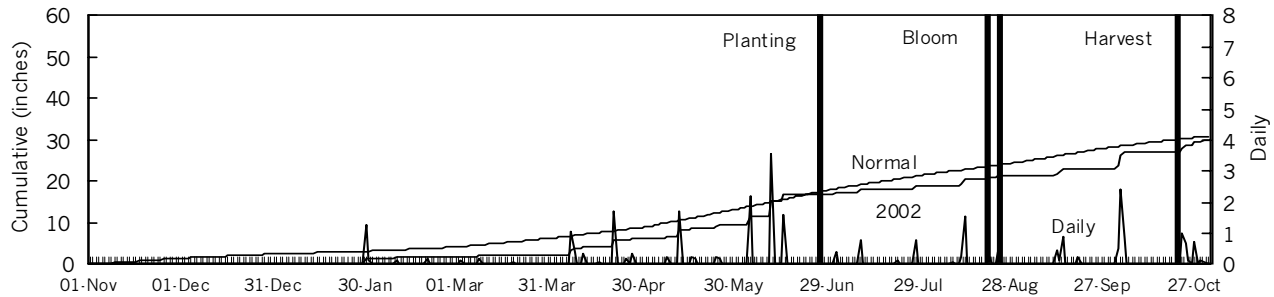

HARVEST DATE: 10/21/02

Soil condition was excellent at the first planting. Unfortunately, 3.6 inches of hard rain the following day caused severe soil crusting. The second planting on the same site was affected by dry soil. Final stands averaged 59% of the target population. Substantial late-season lodging as well as plant population was highly significant. Additionally, on average, lodging and stand irregularities accounted for 13% of yield variation beyond that attributed to hybrid effect.

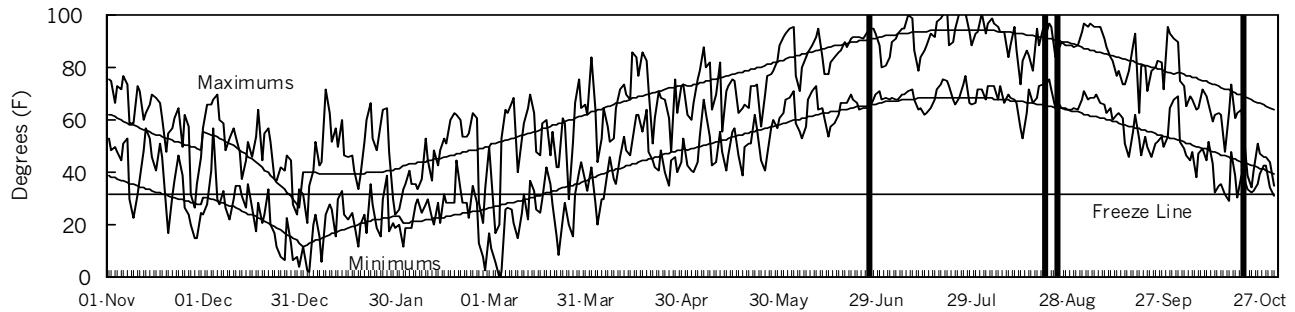

PEST CONTROL:

Treflan 5/28/02, Baythroid 8/23/02

NORTHWESTERN KANSAS IRRIGATED NUSUN SUNFLOWER TEST

LOCATION: Northwest Research-Extension Center, Colby POPULATION: 23,000 plants/a

COOPERATOR: Patrick Evans, agronomist

TEST SITE: Keith silt loam

Sunflower 2000, Corn 2001

FERTILIZATION: 110-25-0

PLANTING DATE: 6/14/02

BLOOM DATES: 8/3/02 - 8/11/02

HARVEST DATE: 10/8/02

PEST CONTROL:

Treflan, June 10; Parathion, August 10

TEST YIELDS:

Avg. (lbs/a): 3350

Range (lbs/a): 2192 - 3830

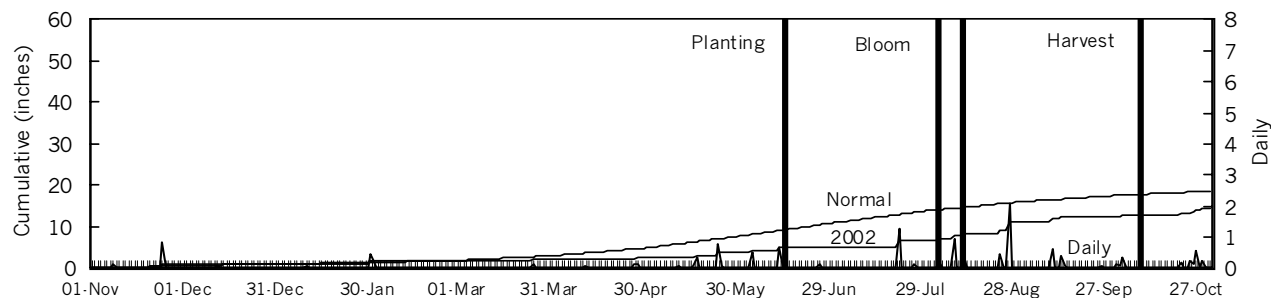

LSD (lbs/a): 393

CV (%): 10

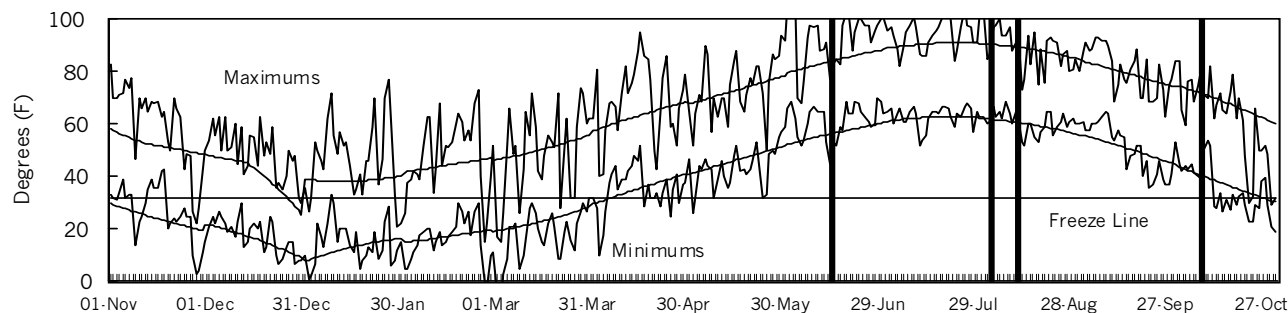

2002 GROWING CONDITIONS

The tests were preirrigated in April and watered again on July 29 and September 4; approximately 3" each time. Insect and weed control was good.

PRECIPITATION

DAILY TEMPERATURES
